

# "The Tlatomi Method"

*In nahuatl (aztec language), tlatomi means "to win money"*

## SETUP

1 - 4 Hour chart (This system works best with **GBP/USD**, **GBP/JPY**)

2 - NonLagMa\_v4

- Filter=20
- Color=1
- ColorBarBack=0

SHI\_SilverTrendSig

- Allbars=0
- Otstup=30
- Per=9.0
- Don't forget to change the colors also (0=blue-1=red)

FX Sniper's Ergodic\_CCI\_Trigger

- pq=4
- pr=8
- ps=5
- trigger=4

## Entry

Enter long when :

- 1 – a blue dot appears
- 2 – the ergodic CCI crosses up the trigger line ( blue line crosses up the red one )
- 3 – NonLagMa color changes to yellow

Enter short when :

- 1 – a red dot appears
- 2 – the ergodic CCI crosses down the trigger line ( red line crosses down the blue one )
- 3 – NonLagMa color changes to yellow

# Exit

Exit when a new dot appears (red if you are long and blue if you are short). This method gives you mechanical trades. Don't hesitate to transform them into a discretionary trade after because you can see things that the system can't. Sometimes, it will be the difference between a 30 pips trade and a 300 pips trade. Once you move your stop to breakeven and add a trailing stop – you can't wait a little more time to see what the market wants to give you.

# Stop

In general, I look for previous daily Resistance-Support but I don't have only one method for my stops. You can also look for the high or low of the previous bar.

# Remarks

## **Price enter :**

The price enter is the open price of the candle or bars where the NonLagMa is yellow.

## **Ergodic\_CCI :**

The signal is stronger when the FX Sniper's Ergodic\_CCI\_Trigger is above 300 or under -300.

## **NonLagMa :**

"The non-lag MA does turn yellow/non yellow while the current candle/bar is still forming ... so i wouldn't enter a trade until the end of the current candle confirms that the yellow section doesn't switch back to a non signal. So remember wait till the candle is fully formed until entering a potential trade!!!!" Matrung (FF member).

What's Matrung says is right but it's depend if you are aggressive or conservative ! If you are aggressive, you can go when the non lag show for the first time a yellow line but if you are more conservative, like Matrung said, wait for the candle to be fully formed.

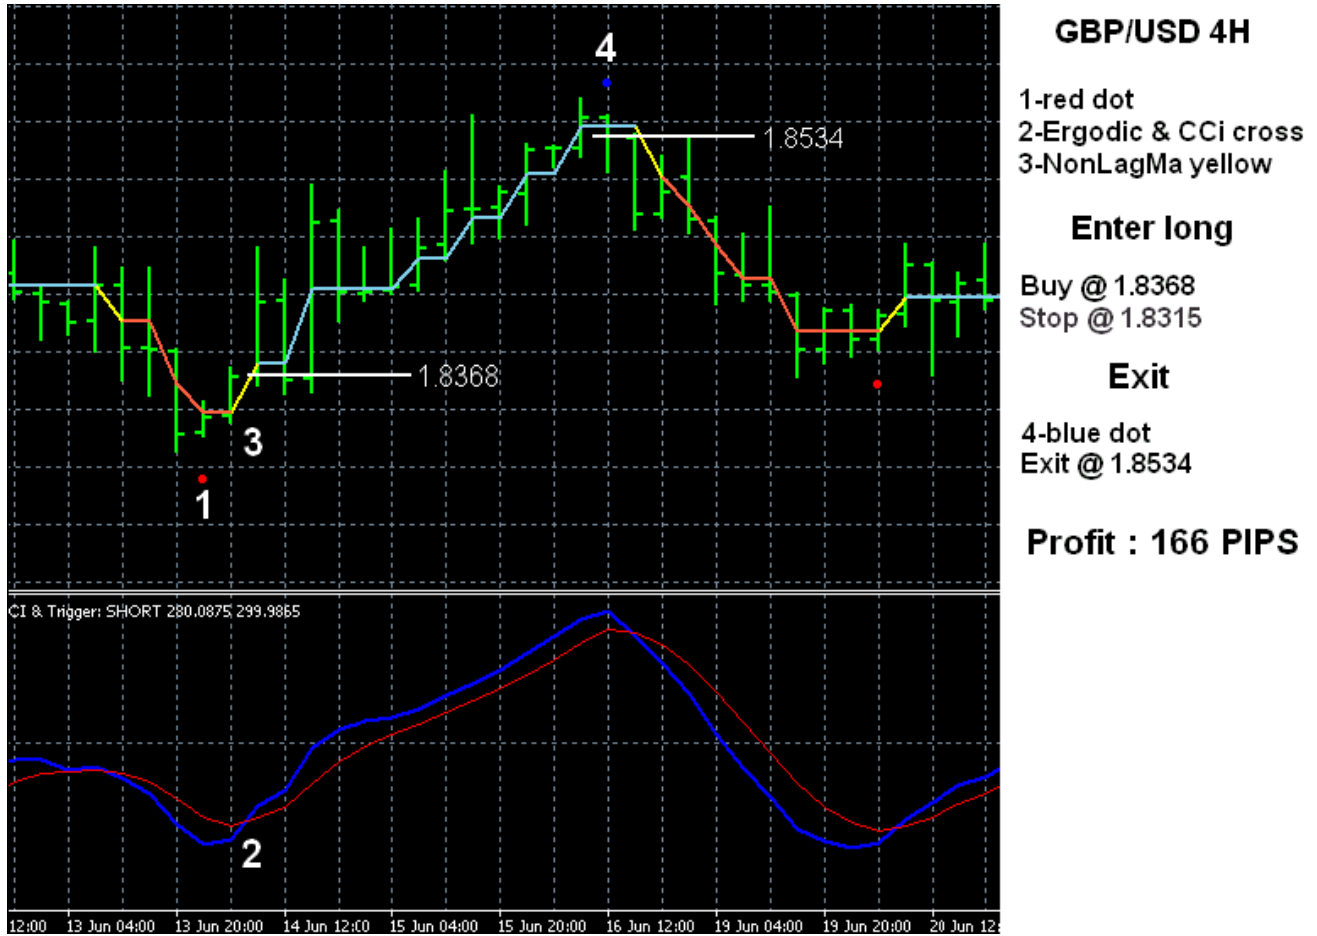

To be more conservative means less profit but also more safety.

## **The order :**

I don't take a trade when the cross happens before the dot or when the cross happens after the nonlag. So, i wait for a dot then for the cross and then for the nonlag.

It doesn't matter if the cross and the nonlag happen at the same time but like i said earlier, the cross should never happen after the nonlag.

# Examples

### GBP/USD 4H

- 1-blue dot
- 2-Ergodic &CCI cross
- 3-NonLagMa yellow

#### Enter Short

Sell @ 1.8395  
Stop @ 1.8471

#### Exit

4-red dot  
Exit @ 1.8184

**Profit : 211 PIPS**
